Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have **to build an algorithm that will detect any bird flying over Peacetopia** and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

Bird recognition in the city of Peacetopia (case study)

Tect, 16 horpoze a lot of decisions to make:

15/15 баллов (100%%)

- What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

<u>Note</u>: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

1 из 1 Баллы

2.

After further discussions, the city narrows down its criteria to:

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

Test Accuracy	Runtime	Memory size
97%	1 sec	3MB
Test Accuracy	Runtime	Memory size
99%	13 sec	9MB
Test Accuracy	Runtime	Memory size

Bird recognition in the city of Peacetopia (case study) Bird recognition in the city of Peacetopia (case study)

15/15 баллов (100%%)

Тест, 15 вопроса

Test Accuracy	Runtime	Memory size
98%	9 sec	9MB

Правильно

Correct! As soon as the runtime is less than 10 seconds you're good. So, you may simply maximize the test accuracy after you made sure the runtime is <10sec.

1 из 1 Баллы

3.

Based on the city's requests, which of the following would you say is true?

Accuracy is an optimizing metric; running time and memory size are a satisficing metrics.

Правильно

Accuracy is a satisficing metric; running time and memory size are an optimizing metric.
Accuracy, running time and memory size are all optimizing metrics because you want to do well on all three.
Accuracy, running time and memory size are all satisficing metrics because you have to do sufficiently well on all three for your system to be acceptable.

7.

You train a system, and its errors are as follows (error = 100%-Accuracy):

Training set error	4.0%
Dev set error	4.5%

This suggests that one good avenue for improving performance is to train a bigger network so as to drive down the 4.0% training error. Do you agree?

Yes, because having 4.0% training error shows you have high bias.
res, because having 1.0% training error shows you have high blas.

(Yes, because this shows	vour bias is hi	igher than v	our variance

No, because this shows your variance is higher than your bias.

No, because there is insufficient information to tell.

Правильно

1 из 1 Баллы You ask a few people to label the dataset so as to find out what is human-level performance. You find the Birdorecognitionation the city of Peacetopia (case study)

Тест, 15 вопроса

It is now harder to measure avoidable bias, thus progress will be slower going forward.

Правильно

1 из 1 Баллы

13.

It turns out Peacetopia has hired one of your competitors to build a system as well. Your system and your competitor both deliver systems with about the same running time and memory size. However, your system has higher accuracy! However, when Peacetopia tries out your and your competitor's systems, they conclude they actually like your competitor's system better, because even though you have higher overall accuracy, you have more false negatives (failing to raise an alarm when a bird is in the air). What should you do?

- Look at all the models you've developed during the development process and find the one with the lowest false negative error rate.
- Ask your team to take into account both accuracy and false negative rate during development.
- Rethink the appropriate metric for this task, and ask your team to tune to the new metric.

Правильно

Pick false negative rate as the new metric, and use this new metric to drive all further development.

15.

The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

Buying faster computers could speed up your teams' iteration speed and thus your team's

Tecr, 15 вопроса

Правильно

Наving built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate.

Правильно, этот вариант не должен быть выбран

If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a ≈10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.

Правильно

Needing two weeks to train will limit the speed at which you can iterate.

Правильно
